Weekly Report - Week 4

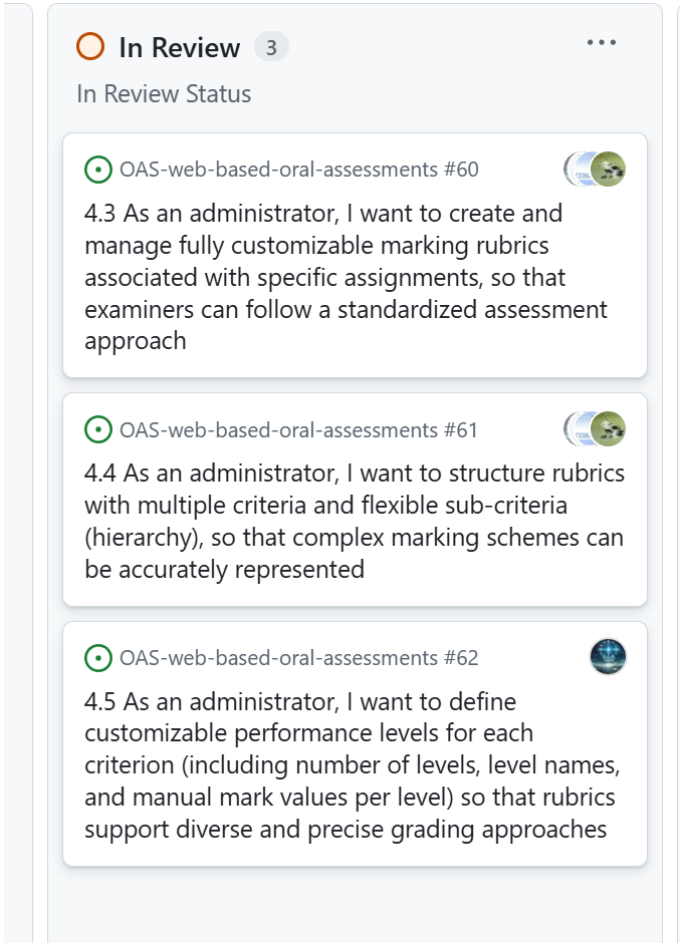

Name: Yukun Fu
Date: August 24, 2025

Tasks Completed This Week

Rubric E2E Integration (Frontend + Backend):

Kanban links:

- Issue #60 — Fully customizable marking rubrics
- Issue #61 — Multiple criteria and hierarchical sub-criteria
- Issue #62 — Customizable performance levels per criterion

Github link: frontend-integration

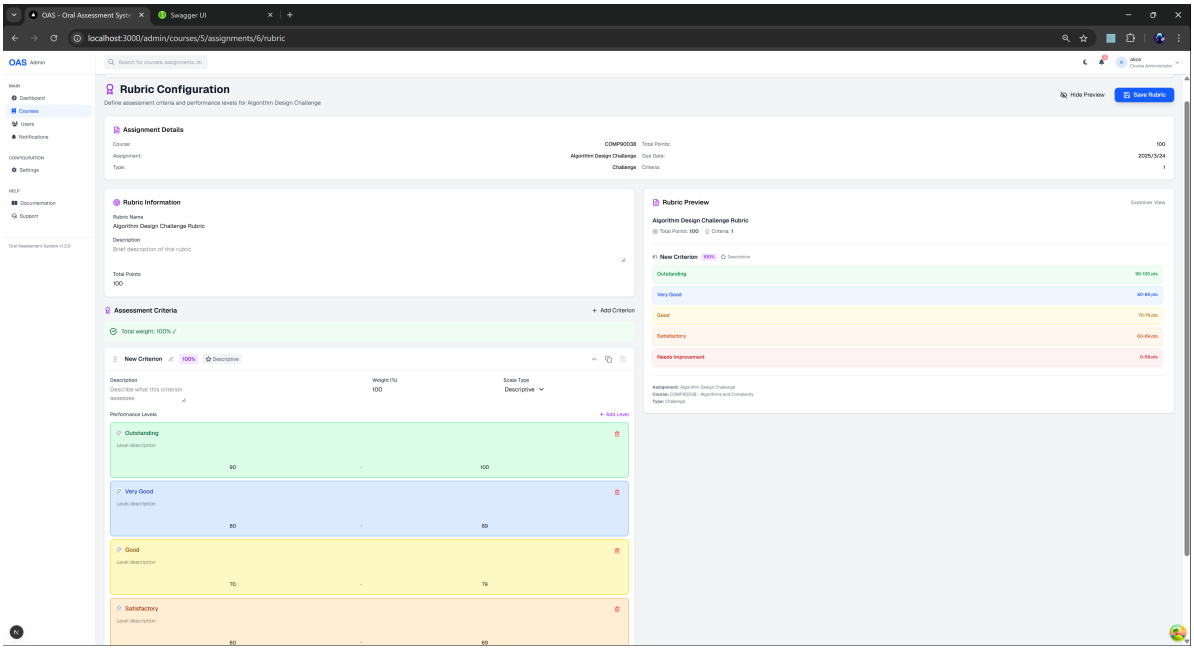

- GitHub (branch): SWEN90017-2025-SM1/OAS-web-based-oral-assessments at `frontend-integration`
- Kanban issues: #60 (customizable rubrics), #61 (multi-criteria & hierarchy), #62 (performance levels)
- Built Rubric Configuration page: add/delete/duplicate/reorder criteria (drag & drop), live preview, empty states
- Implemented strict validation (total weight = 100%) with clear error toasts
- Stabilized controlled inputs (default values for name/description/points) to remove React warnings

- Data mapping layer: aligned frontend structure to backend payloads (`rubricMetaInfo`, `rubricsInfo[]`, `performanceLevel[]`)
- Backend contract: PUT `/api/assignments/{id}` to update rubric alongside assignment; tolerant parsing of responses
- Enhanced logging (request/response) for quick diagnosis; refined Save button enablement (only disabled while saving)

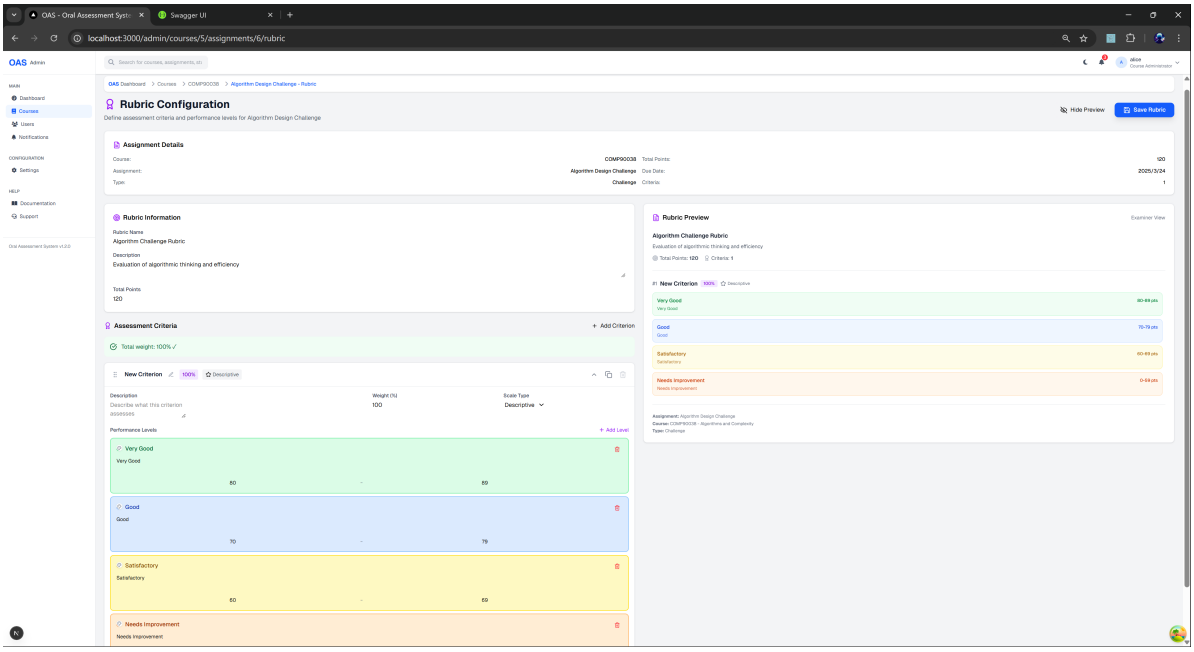

Routing & UX Enhancements:

- Kept consistent breadcrumb and navigation flow from assignment to rubric configuration
- Preserved editing state and improved feedback on success/failure

Rubric list page:

Rubric update result(delete outstanding):

Time Allocated: 13 hours

- 2h analysis & payload alignment
- 7h development (UI + mapping + validation)
- 2h integration & debugging (logs, error handling)
- 2h UX polish & documentation

Key Issues Encountered

1. Contract drift: `rubricsInfo` vs `rubricInfo`, stringified `rubricMetaInfo`, occasional partial `performanceLevel`.
2. Silent validation: total weight ≠ 100% blocked save without obvious feedback.
3. Controlled input stability: undefined values from incomplete payloads triggered warnings.

Resolutions

- Introduced a central mapping layer with tolerant parsing and safe defaults.
- Added explicit client-side validations and actionable toasts.
- Strengthened request/response logging and adjusted Save-button policy.

Plan for Next Week

Backend & API

- Push naming/structure consistency; add regression checks for payload changes.
- Extend mapping/tests for sub-criteria (hierarchy) support.

Enhancement & Testing

- Level range overlap and bounds-consistency validation.
- Unit tests for mapping/validators; performance profiling (virtualized/conditional rendering if needed).
- Documentation: data model, sample payloads, error codes, troubleshooting.
