1. Tasks Completed

1. I delivered several key improvements to the session management API:

   Session Status Refactoring: Changed the status field from a database value to a dynamically calculated staffing indicator (none/partial/fully), providing clearer insight into examiner assignment progress.

   API Contract Improvements: Made the date parameter required for session listings, removed duplicate legacy fields from response DTOs, and standardized the outsideAssignmentRange flag to return false (instead of null) when dates are valid.

   Enhanced Filtering: Added optional venueId parameter support to the calendar API, enabling venue-specific session data retrieval.

   Extended Summary Statistics: Introduced three new aggregate fields—totalAssignedExaminers, totalCapacity, and totalBooked—giving administrators a complete overview of examiner staffing and student booking metrics in one response. (8h)

   See commits:

   feat: Add examiner and student statistics to session summary
   feat: Add optional venueId filter to calendar APIfeat: Add date and includeFullSlots query parameters to timeslots API
   fix: Improve outsideAssignmentRange flag consistency
   refactor: Remove duplicate statistics fields from session response
   feat: Make date parameter required for session list API
   refactor: Change session status to reflect examiner staffing level

2. Attend weekly meeting. (2h)

2. Key Issues

Challenges Addressed:

- Resolved duplicate statistics fields issue: The API was returning both legacy root-level fields (fullyStaffed, partiallyStaffed, unstaffed) and a summary object with the same data, causing confusion and null values in responses.

- Fixed ambiguous outsideAssignmentRange behavior: Previously returned null for valid dates, making it unclear whether validation occurred or the field was simply unset.

- Improved status field semantics: The original status reflected database state (e.g., "available") rather than the more useful examiner assignment status, requiring frontend to recalculate staffing levels..

3. Plan for Next Week

- Keep refine APIs.
- Help to finish some unfinished features.
