1. Tasks Completed

- Write some code for Epic 5 user stories (6h)

  Pre-definition of timeslot:

```java
package org.swen90017.oas.entity;

import ...

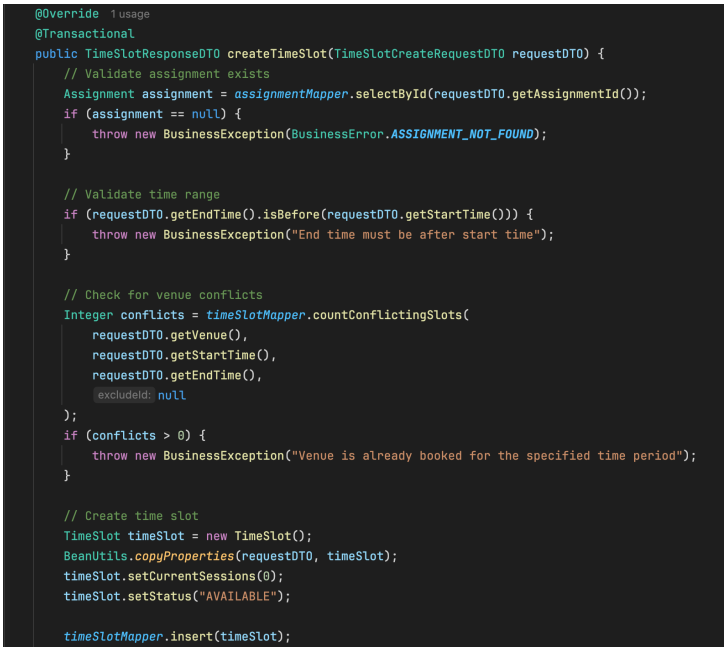

/**
 * Time Slot Entity
 * Represents an examination time slot
 */
@Schema(description = "Time slot entity for examinations")  16 usages
@Data
@TableName("time_slot")
public class TimeSlot {

    /**
     * Time slot ID (Primary Key)
     */
    @Schema(description = "Time slot ID", example = "1")
    @TableId(value = "id", type = IdType.AUTO)
    private Long id;

    /**
     * Assignment ID (Foreign Key to assignment table)
     */
    @Schema(description = "Assignment ID", example = "1")
    @TableField("assignment_id")
    private Long assignmentId;

    /**
     * Start time of the slot
     */
    @Schema(description = "Start time", example = "2024-03-01T09:00:00")
    @TableField("start_time")
    private LocalDateTime startTime;
```

  Service implementation for examine part:

```java
    @Override  1 usage
    @Transactional
    public TimeSlotResponseDTO createTimeSlot(TimeSlotCreateRequestDTO requestDTO) {
        // Validate assignment exists
        Assignment assignment = assignmentMapper.selectById(requestDTO.getAssignmentId());
        if (assignment == null) {
            throw new BusinessException(BusinessError.ASSIGNMENT_NOT_FOUND);
        }

        // Validate time range
        if (requestDTO.getEndTime().isBefore(requestDTO.getStartTime())) {
            throw new BusinessException("End time must be after start time");
        }

        // Check for venue conflicts
        Integer conflicts = timeSlotMapper.countConflictingSlots(
            requestDTO.getVenue(),
            requestDTO.getStartTime(),
            requestDTO.getEndTime(),
            excludeId: null
        );
        if (conflicts > 0) {
            throw new BusinessException("Venue is already booked for the specified time period");
        }

        // Create time slot
        TimeSlot timeSlot = new TimeSlot();
        BeanUtils.copyProperties(requestDTO, timeSlot);
        timeSlot.setCurrentSessions(0);
        timeSlot.setStatus("AVAILABLE");

        timeSlotMapper.insert(timeSlot);
```

Code still need to be refined and validated, so it is not committed yet.

- Assist Yanqing with frontend-backend integration testing, start the backend service, check backend responses, and adjust the database to coordinate with frontend requests (2h)
- Have a meeting to wrap up epic 4 related work (2h)

2. Key Issues

The definition of timeslot is not completed. This affects the development related to Epic 5.

3. Plan for Next Week

- Continue to implement Epic 5 user stories.
- Conduct integration testing with the frontend.
